

Name: Eran Young
ID: 20548502

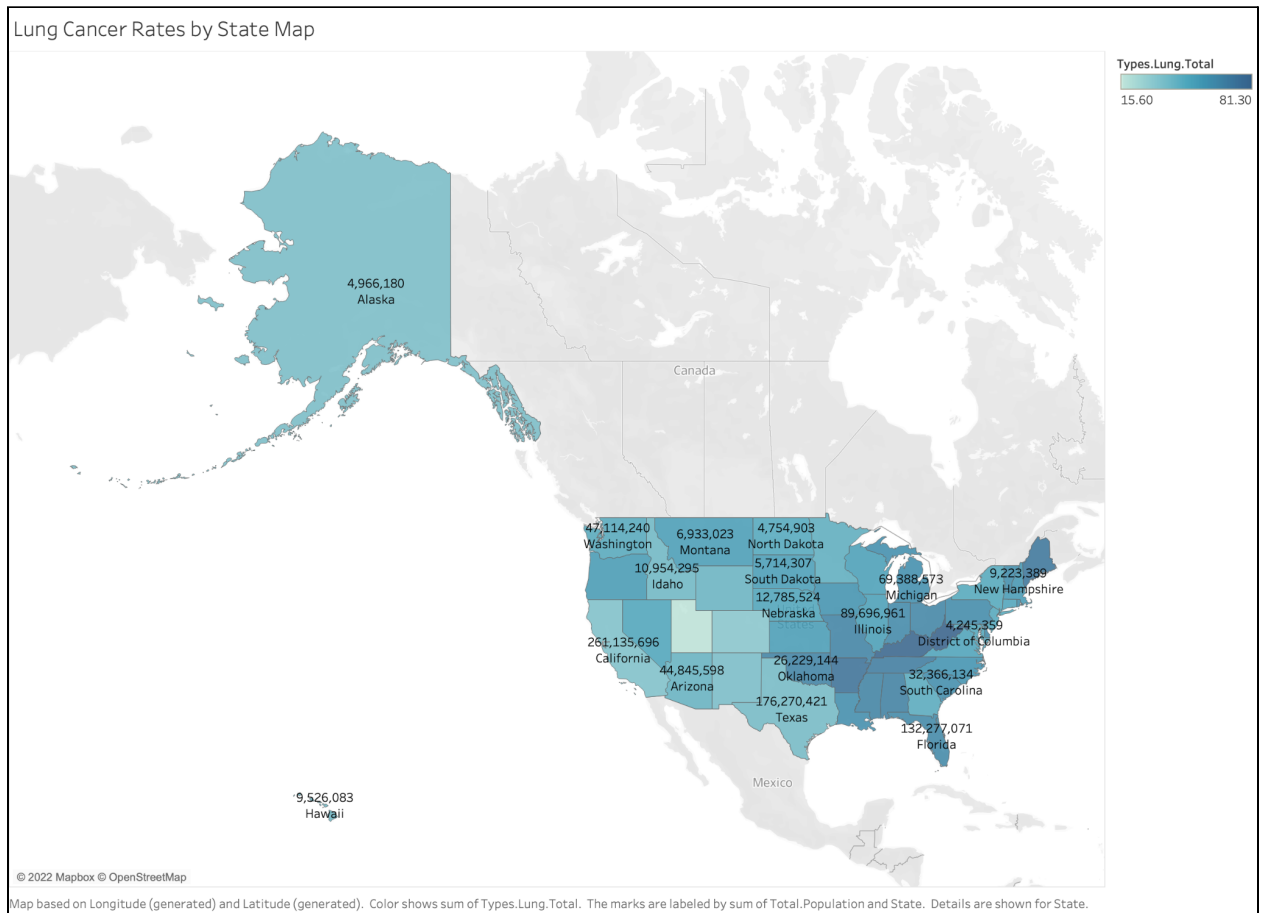

Dataset : [cancer](#)

Findings:

1. Cancer rates are generally lower across all states for Asian and Hispanic people, and generally higher for Black and White people. Indigenous people have the greatest amount of volatility in their cancer rates with some states having far higher rates than others.

2. States with the highest lung cancer rates are generally found in Middle America.

3. Males and Females share relatively similar cancer rates throughout the age groups except in the case of adults above the age of 64. In this case males have a far greater rate of

cancer than females.
